antibody. It was obtained from total RNA extracted from a SB3 hybridoma by RT-PCR. SB3 is an IgG1 antibody derived from a TNP-KLH immunised mouse. Its binding to TNP or DNS antigen can be blocked by very low amounts of TNT and it can therefore be used in a method for detecting small assayed explosive molecules. Molecules are detected using a plezcelectric sensor. Plezcelectric immunosasaying in liquid phase allows stationary and flow analysis of an aqueous sample. The method is sufficiently sensitive for detection of low molecular weight
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 ATGAGAGTGCTGATTCTTTTGTGGCTGTTCAACCCTTTCCTGGTATCCTGTCTGATGTG

                                                                                                                                                                                                                                               The sequences given in AAQ30755-56 were used in example to illustrate the production of a human antibody which recognises human interleukin-6 receptor (LI-6R). The antibody comprises light (L) chain and heavy (H) chain variable regions which were derived from a mouse monoclonal antibody produced from the hybridoma PMI which (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    TCTCTCAAAAAGTCGAATCTCTATCACTCGAGACACACCAGGAACAGTTCTTCCTACAG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated specific binding member (I) which recognizes an epidermal growth factor receptor (EGFR) epitope which is recognizes an epidermal growth factor receptor (EGFR) epitope which is count in tumourigenic. hyperproliferative or abnormal cells and not detectable in normal cells. The EGFR epitope is located within the region comprising residues 273-501 of EGFR and does not demonstrate any amino comprising residues 273-501 of EGFR and does not demonstrate any amino caid sequence alterations or substitutions from normal EGFR. (I) is capable of binding the de2-7 EGFR at an epitope distinct from the capable of binding the de2-7 EGFR at an epitope distinct from the capable of binding the de2-7 EGFR at an epitope distinct from the command wild-type gene. The binding member comprises the VH and VL collypeptide sequence of monoclonal antibody (mAb) 806. (I) is useful for treating or diagnosing human or animal body, especially for treating or treating caneer which is located in or adjacent the communitied EGFR, de2-7EGFR or EGFR with high mannose glycosylation; where EGFR is measured by contacting a biological sample from a mammal in which EGFR to the antibody to occur, and detecting whether binding has occurred between the EGFR from the sample and the antibody, where the detection of binding indicates that presence or activity of the EGFR in eaction of binding indicates that presence or activity of the EGFR in eactivity of an EGFR which indicates the

existence of a tumour or cancer in the mammal. A pharmaceutical composition comprising (I), and optionally vehicle, carrier or diluent is useful for preventing and/or treating cancer in mammals, especially for treating brain-resident cancers that produce aberrantly expressed EGFR in mammals, such as glioblastoma, medulloblastoma, meningioma, neoplastic astrocytoma or neoplastic arteriovenous malformations, and malignant neural tumours in mammals. The present sequence represents the mAb 806

                                                                                                                                                                       Monoclonal antibodies which inhibit type II phospholipase A2 are useful in the treatment of myocardial infarction, cerebral infarction, acute kidney failure, chronic rheumatism, cardiac shock, pancreatitis, adult respiratory distress syndrome and colitis. The antibodies were generated by immunising Balb/C mice with recombinant human type II phospholipase A2. Spleen cells from the mice were fused with mouse myeloma P3U1 (P3x63Ag8.U1) and the hybridomas obtained were screened for phospholipase A2 inhibitory activity. Active clones were isolated including 12H5, 1.4 and 10.1. These were cultured and the antibody isolated from the culture
                                                                                                                                                                                                                                                                                                     supernatant by precipitation with ammonium sulphate and purification on a column of protein A-Sepharose CL4B. Because the antibody acts on the primate and mouse forms of enzyme as well as human it is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Monoclonal antibody 1.4 heavy chain against type II phospholipase A2

The present sequence encodes the monoclonal antibody 1.4 heavy chain against type II phospholipase A2, from the present invention. The present invention describes a novel method for the amelioration of kidney disorders (such as acute renal failure) associated with the administration of cisplatin for the treatment of cancer. The method comprises treatment with a monoclonal antibody which inhibits the cativity of type II phospholipase A2 (particularly of type II phospholipase A2 (particularly of type II phospholipase A2 (particularly of type II phospholipase A2 and contening a part of the possessing the same inhibitory activity and contening a part of the antibody sequence. Preferably the antibody also inhibits the activity of ape and/or mouse type II phospholipase A2, and has the ability to release type II phospholipase A2 bound to a cell membrane. Three specific monoclonal antibodies having these properties which can be used are 12H5, 10.1 and 1.4, derived from hybridomas FERM BP-5300, FERM BP-5298 and FERM BP-5297 respectively. The method can be used for suppressing the nephrotoxicity which is a characteristic feature of cisplatin administration, and therefore allowing more efficient use of this drug as an anticancer agent, e.g. by allowing an increased dosage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           120

The sequence was derived from RNA isolated from hydridoma cells from mouse spleen cells. The protein can be used for binding heavy metals, such as lead cations. It can be used for detecting, removing, adding or neutralising the heavy metals in biological and inanimate systems. It can be used in e.g. aqueous liquid systems, in biological or environmental systems or in such compositions as perfumes, cosmetics, pharmaceuticals, health care products, skin treatment products, pesticides, herbicides, solvents used in the production of semi-conductor and integrated circuit components and production materials

When the TP is fused to the envelope protein, it replaces or disrupts the natural receptor binding site. By using a TP that recognises a cell surface antigen, the retroviral vectors containing TP's can be used in a cell type specific method for introducing genes into cells. These retroviral vectors can be used in the gene therapy of human genetic diseases including, adenosine deaminase (ADA) deficiency, and in clinical trials

The patent discloses a novel retroviral vector, particularly Spleen
Necrosis Virus (SNV) vector, having target cell specificity. The vector
has a targetting envelope which is a chimeric protein consisting of an
antigen binding site of an antibody (e.g. anti-DNP-SCPV) or another
peptide that binds to a specific cell surface protein, fused to the
carboxy terminal part of the retrovial envelope protein. The presence
of the wild type envelope protein serves as a helper molecule to
improve or supplement a functional membrane fusion domain. The
carboxing site replaces the natural viral receptor binding site.
The retroviral vector is used for cell specific gene transfer,
especially in gene therapy. The invention overcomes the restricted host
crange limitation of retroviral vectors. The present sequence is a gene
encoding single chain antibody (serv) against hapten dinturphenol
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              120

```

```
The present invention describes the detection, in a subject, of antibodies (Ab) that recognise an integrin (1) when bound to its agonist or antigonist (II) comprises forming a (I)-(II) complex, incubating this with source of Ab and detecting Ab that binds.

Crug-dependent antibodies (B) to detect formation of, or increase in, drug-dependent antibodies (DAb) in response to treatment with (II), articlerally to identify treatments less likely to cause side-effects; (b) to identify subjects at increased risk of developing side-effects when treated with (II); (c) to determine if a particular (II) potentiates formation of epitopes recognized by Ab; and (d) to identify (II) less likely to induce DDAb or epitopes recognized by existing DDAb. Chimeric antibodies against a complex of (I) and a particular (II) are used as positive controls in the method. The present sequence represents a specifically claimed chimeric antibody heavy chain nucleotide sequence. (II) are used to treat thromboembolic disorders, e.g. angina pectoris, myocardial infarction, stroke, or pulmonary embolism, but may cause.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CAGCTTCAGGAGTCAGGACCTGGCCTCGTGAAACCTTCTCAGTCTCTGTCTCTCACCTGC 133

                                                                                                                                                                                                                                                                                                   The genes coding for the heavy and light chain of an antibody against DNP were provided by Dr Ogawa of Scripps Clinic, La Jolla, Ca. The genes were sequenced and published (Riley et al. 1986). Using PCR a single chain antibody gene was constructed using the signal peptide against DNP. The PCR product was cloned into the Smal site of pBluescript. DNA sequencing confirmed the successful combination of the two gene segments coding for the variable regions of the annigen binding peptide. The complete sequence of the anti-(Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The constructed plasmids pFv (TU27)-DE and pFv (TU25)-DE which express polypeptides consisting only of the V regions were purified and sequenced. The polypeptides are capable of binding to the beta chain of IL-2 receptor and of inhibiting the binding of IL-2 to the receptor. They are useful as immunomodulators and immunosuppressants, e.g. to prevent graft rejection or to treat inflammatory allergic and autoimmune diseases, or leukemia. Unlike cyclosporin etc. they are both effective and safe. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                for

Using this poly(A) RNA as antibody-producing hybridoma UK1-3 calls. Using this poly(A) RNA as a template, an anti-urokinase antibody VK cDNA was amplified with the mC-kappa primer as primer for first strand sysnihesis, and the 3'mV-kappa primer so primers for the PCR. The amplified fragment was restriction disested and ligated into a restriction fragment of pTB1423 to give an anti-urokinase antibody VK cDNA contg. plasmid pTB1456. The sequence of this plasmid is given in AAQ25667. The cDNA is a functional VK gene. The sequence of (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Valuable compounds are isolated from complex mixtures by use of immobilized ligands composed of an anchoring protein and a binding protein. A gene encoding such a chimeric protein that will anchor in the cell wall of a lower eukaryote, e.g. S. cerevisiae, and which blinds traseolide with high specificity, was constructed using plasmid pUR4143. This plasmid contains a gene encoding an scPv-TRAS fragment of anti-traseolide antibody 02/01/01 (AAQ67358) obtained by PCR amplification of hybridoma cDNA using primers AAQ67353-54 for the heavy chain, and primers AAQ67355-56 for the light chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AACCAACTGGAGTGGATGGGCTACATAAGCTACAGTGGTAGCACTAGCTACCATCT

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
